Exercise: Checkpointing

ID no. 6733101021 Name Thanakrit Numnuan

Consistant Cut: when P_1 have the error

it rolls back to the 4th checkpoint.

because no other message were sent by P_1 after this point, the rollback doesn't "unsend" any thing, therefore no orphan,

therefore P0 P2 P3 can remain at 4th check point as well.

Strongly Consistant Cut: it forbid in-transit M

so if we use the 9th checkpoints. the last messege sent from $P3 \rightarrow P2$ crosses the cut line so we roll back on P3 to the 3rd checkpoint, clearing the network channel of that in transit message
